# A Survey of Pears, Nuts, and Other Fruit Clones in the United States

Agricultural Research Service  
U. S. DEPARTMENT OF AGRICULTURE

## PREFACE

This publication is the third of a series of surveys to determine the amount of clonal stocks of fruit and nut crops currently being maintained by Federal and State experiment stations. The first of the series covering apples was published in May 1963 and the second on stone fruits in December 1963.

This survey was conducted at the request of the National Coordinating Committee on New Crops. Its purpose is to obtain an indication of the volume of material that would be involved in establishing clonal germ plasm repositories for the use of fruit breeders throughout the country.

## ACKNOWLEDGMENT

Gratitude is expressed for the assistance of H. F. Winters of the New Crops Research Branch, Crops Research Division, Agricultural Research Service, under whose direction the questionnaire was designed and initial distribution made. The author also acknowledges the work of D. D. Dolan, W. R. Langford, W. H. Skrdla, and L. A. Mullen, coordinators of the New Crops Regional Cooperative Program, through whom the data used in this survey were obtained from the State experiment stations. Finally, it is recognized that much extracurricular work was expended by the various experimental stations in completing the questionnaires.

# A SURVEY OF PEARS, NUTS, AND OTHER FRUIT CLONES IN THE UNITED STATES

H. H. Fisher  
Crops Research Division  
Agricultural Research Service  
United States Department of Agriculture.

## INTRODUCTION

The necessity of perpetuating species, strains, and cultivars of plants for use by research workers in agriculture and related fields has long been recognized. Much has been written on the subject, but the responsibility for the maintenance of such plant stocks rested upon the Federal plant introduction stations and those State and private institutions interested in specific items. Loss of interest in given groups of plants or attrition of funds and personnel has often resulted in a loss of specific items making them no longer available to the free world. The value of germ plasm thus lost will never be known.

An approach to the problem of preserving germ plasm for future use was considered by the National Research Council in 1944. After due consideration of the Council's recommendations, the Congress wrote a provision into the Research and Marketing Act of 1946 that the U. S. Department of Agriculture set up a National Program for the--preserva-

tion of new and useful plants of potential value--and for the preservation of valuable germ plasm.

The National Coordinating Committee for New Crops appointed a subcommittee to make surveys to determine how best to preserve germ plasm in seed form. As a result, the National Seed Storage Laboratory was established at Fort Collins, Colorado, in October 1958 by the U. S. Department of Agriculture.

The maintenance of germ plasm as seeds only partly solves the problem. Germ plasm of asexually propagated plant materials presents a more costly and complex proposition. Repositories in several locations to accommodate the climatic requirements of the various types of plants would be necessary. Sanitation and cultivation would also vary with the material involved. A technical staff would be needed to determine the best means of perpetuating the clones and keeping abreast with other problems that would arise.

As an approach to the second phase of

the germ plasm storage problem, which involves asexually propagated material, the New Crops Research Branch, Crops Research Division, was requested by the National Coordinating Committee for New Crops to assume leadership in making a survey of the clonal material being maintained in this country. It was decided to undertake the tree fruits and nuts first. A questionnaire was prepared on 5" by 8" file cards in the format shown on page 4. The initial distribution of questionnaires was made to State experiment stations through the Regional Plant Introduction Stations in October 1959. Other Federal Stations were contacted direct by the Branch.

This present compilation is a survey rather than an inventory since it was not intended that this work be exhaustive. There are many institutional, commercial and private plant collections scattered throughout the country that probably contain clones not to be found at any of the locations contacted in this survey. To have solicited inventories from each of these would have involved work disproportionate to the basic purpose of the survey.

The first tabulation of questionnaires returned to Branch headquarters

at Beltsville, Maryland, was made in May 1961. An analysis showed that of the 8,660 items reported 44.6 percent were apples, 30 percent were stone fruits, 15.6 percent were pears, 4.5 percent were nuts, and 5.3 percent were miscellaneous items.

As a result of this preliminary analysis, it was decided to publish the survey of deciduous fruits and nuts in three parts: I. Apples, II. Stone Fruits, III. Pears, Nuts, and Other Fruits. Other surveys will be assembled covering (1) vegetables, and (2) forage and turf, in order of priority established by the National Coordinating Committee.

In this publication the clonal material of pears, nuts, some of the small fruits, and a few of the subtropical, deciduous fruits maintained at Federal and State experiment stations is tabulated in the same fashion as was that of the fruits in the previous two publications. (ARS 34-37-1 and ARS 34-37-2).

As is pointed out in Research Bulletin 790 of the Ohio Agricultural Experiment Station the vast number of pear varieties, largely of European origin, that were established in this country during the 19th Century has dwindled to comparatively few. In an attempt to re-establish many of the lost varieties, an active introduction

program was carried out by the Plant Introduction Section (progenitor of the New Crops Research Branch) during the first half of this century.

When propagating material of a pear variety arrived at the USDA Plant Inspection Station, it was given a Plant Introduction (PI) number and recorded in the Plant Inventory with the name that appeared on the label. Through research and correspondence F. C. Bradford who was in charge of the Glenn Dale, Maryland, station during the period when most of the introductions were made, corrected the names on some of the material. In some cases, these changes were not made in the PI Inventory. F. S. Howlett, author of the Ohio 790 Bulletin based his nomenclature on the notes of Bradford. Therefore, the names of numbered accessions that appear in the bulletin are given preference to those in the Plant Inventory.

Varieties in the pear collection of the Oregon Agricultural Experiment Station are well described in Technical Bulletin 41 of that station.

The reporting of subtropical fruits is limited almost entirely to the U. S. Plant Introduction Station, Miami, Florida.

No attempt was made to cover citrus and citrus relatives in this survey. Technical Bulletin 633 of the Florida Agricultural Experiment Station lists the species, varieties, and relatives in 70 citrus collections in 40 countries, including 13 collections in the U. S.

A few small collections of such minor fruits as jujube, juneberry, and hawthorn were reported but are not listed in this survey.

The information obtained from the questionnaires was edited for botanical names and Plant Introduction numbers. Common names were edited insofar as reliable references are available. Some descriptive information obtained by correspondence and a search of literature was added by the author.

It should be understood that the listing of any item in this survey does not guarantee that the item will be available from the indicated source in the future.

The key to the reporting stations and the abbreviations used in the descriptions appear on pages 5 through 9.

## French Selections

During the latter half of the 19th century phylloxera threatened the grape industry in France. Propagating material of nearly every American variety and species was sent to France to be tried as resistant rootstocks for the French wine grapes. In addition to the use as rootstock, the plant breeders made many crosses between the French varieties and the American varieties in an attempt to combine the wine qualities, table qualities, and insect and disease resistance. These hybrids became known by the names of the breeders who produced them.

As the grape industry in the United States developed during the first half of the 20th century, the French-American hybrids were much in demand as breeding stock for varieties adaptable to the industry and growing areas in this country. In addition to their value as rootstock and high yielding qualities, one of them (Seyve-Villard 12-375) exhibits high resistance to black rot.

Some of the hybrids were imported during the decade of the 30's, but the bulk of them were received in the late 40's and early 50's. The post entry quarantine requirements for nearly all of the material were satisfied at the U. S. Plant Introduction Station, Glenn Dale, Maryland; and distribution was made from that point.

Most of the 285 grape hybrids listed below were reported by the Davis, California station with a few each reported by the Oklahoma and Pennsylvania stations,

HYBRIDS

Most of the hybridization work with filberts was begun by John Franklin Jones (1871-1928) in 1917. In 1919 he made several successful crosses of C. americana X C. avellana. These became known as the Jones' Hybrids. From these hybrids several commercial varieties were evolved. The Agricultural Experiment Station in Illinois is maintaining several of the clones, and 18 of the clones are reported by the Pennsylvania experiment station.

CORYLUS SPECIES

C. americana		Station	Native, 10', shy bearer, Suckers.	5363	NdM
C. colurna				Clone 1 & 2	IlU
C. heterophylla	68977	Manchuria, 1926	Ht. 6-7', hdy., v. shy bearer.	8695	NdM
